The contact surface between the surface of A Guide To Plunger Lubricants piston and the surface of the injection sleeve is the outer surface of the plunger piston ring. Due to the pulsing flow that comes from a plunger pump, a soft discharge or pulse hose needs to be used in all systems. The outside diameter of the plunger piston ring 16 is greater than the outside diameter of the plunger tip 8 and in fixed and moving contact with the inside of the injection sleeve 6. It may be necessary to replace valves. Then after either a specific tubing or Chemical compatibility is crucial to the function and life of our pumps. Below are some possible causes: Problematic inlet conditions Inlet hoses can become pinched, collapsed or develop tiny holes and affect pump performance. In the injection cycle, the injection unit piston drives the piston rod, connection rod and injection piston upwardly within the injection sleeve transporting the molten metal in the injection sleeve into the runners and die cavities. The flexibility of the injection piston ring 16 provides less wear on the inside of our SDSs.
